KNX Internet of Things

KNX and the Internet of Things – simple Integration by KNX Web Services (KNX IoT 1.0).

BRUSSELS, 25th of October 2016: The “Internet of Things” is a buzzword in the world of information technology. What still has to become part of the general knowledge is already a long known term in expert groups for a new development boost. Everyday objects become intelligent and communicate via the internet. According to visionaries until 2020 50 trillions of such objects will communicate via the internet. However, the Internet of Things is not still up in the air but has become reality already today. Already for a long time the KNX Standard forms part of this global IoT world. By the introduction of the KNX Web Services (KNX IoT 1.0) KNX underlines its leading position and opens new ways in the operation and visualization of KNX systems.

Since a long time the Internet of Things (IoT) has found its way into nearly all areas of life – even in building automation. Global players like Google or Apple penetrate into this market of the future and try to emphasize their philosophy of intelligent buildings by networkable products. When trying to find in the vast number of systems a solution suited for him the user gets more problems than answers. For instance the hardwired window contact of system A is not capable to communicate with the wireless valve drive of manufacturer B. In addition proprietary automation solutions usually require a central server for the exchange of data between the installed components, which cannot communicate directly with each other like it is possible in case of KNX.

KNX is a „Thing“ in the Internet since long time

Since the beginnings of the technology KNX disposes over all IoT features. KNX devices can be seen as physical objects, which are clearly identifiable and able to exchange data. The media TP, RF, PL and IP take care of the network connectivity. KNX itself is an “Internet of Things”. Amongst others the main features of this decentrally organized bus system are the compatibility of the devices and the possibility to communicate with each other. This ensures for the installations e.g. a high degree of availability.

However: It requires the technical expertise of KNX installers combined with the effort for the parameterization. That is, as a general rule, no problem for KNX installers but in fact already for IT experts. Standardization does not exist. If one tries to access from the world of internet to the “Thing” KNX, i.e. the building automation, in a simpler way, new ways have to be opened.

About KNX

KNX Association is the creator and owner of the **KNX** technology – the worldwide STANDARD for all applications in home and building control, ranging from lighting and blind control to various security systems, heating, ventilation, air conditioning, monitoring, alarming, water control, energy management, smart metering as well as household appliances, audio/video and many more. **KNX** provides a single, manufacturer independent design and commissioning tool (ETS), with a complete set of supported communication media (TP, PL, RF and IP) as well as a complete set of supported configuration modes (system and easy mode). **KNX** is approved as a European (CENELEC EN 50090 and CEN EN 13321-1) and an International standard (ISO/IEC 14543-3). This standard is based upon 26 years of experience in the market. Over 420 member companies worldwide from different application domains have more than 7000 KNX certified product groups in their catalogues. The **KNX** Association has partnership agreements with almost 60,000 installer companies in more than 143 countries.
